Dear Sir:

I read of the Giant Eye falling to the earth, and the trauma it caused you and many others. I have a good solution for your trouble, having come close to making a 100 foot dish for the Bureau of Standards.

The reason I did not get to complete this dish was the cancelling of all Solar contracts for the D.O.E. by Ronald several years ago. However, the bureau did say they would give me a patent for my trouble, but it would have been a patent only on the process of making large dishes and not the finished article. I have several patents and find that in the main, the public more apt to copy a patent when all the information is there on a patent to be copied more easily. The bureau did swear that it would be kept most confidential. However, I have heard there are some large dishes being made by this process, but have been unable to get information about them and am about to discount the source.

If you could give me some kind of assurance that the information would be kept confidential, I would be glad to tell you everything you might need to make any kind of decision you might wish.

To reassure you I can tell you I have a B. S. in Me from Texas Univ. graduating in the class of 1935, having been highest grade holder in my class for all 4 years, and in my senior year made more grade points than anyone had made except two Japanese Students in prior years. It so turned out that time has proven the truth for the question I answered that the pro gave me a B instead of A for. I made 7 A's and one B. my answer being correct. The reason I give you this information is that you can check up on it easily, being in the University there. I'm a Tau Beta Pi, and Pi Tau Sigma

The cost for a 100 foot dish in my first offer was \$100,000.00 using a hangar up in Minn. in which to fabricate it. The 300 foot I would make for you would be made in the desert and probably take 6 months.

I have tested my idea having gone into the mfg. of satellite dishes after Ronald cut us off.

Yours truly,

Ralph C. Inzel
