

ADDENDUM TO VLA TECHNICAL REPORTS NO. 10 AND 11

CRYOGENICS CONTROL AND PUMP
REGULATOR TEST SET

S. LYMPANY

DECEMBER 1977

(Issued November 1978)

The cryogenics control section of the test set provides loads and neon indicators for the pump valve, refrigerator, and heater circuits, calibration provision for the temperature sensors and a variable current source for adjusting and checking the vacuum meter.

The pump regulator section provides $\pm 15V$, a simulated pump load, a monitor for pump voltage, a heater, and remote pump shut-down capabilities.

PRINCIPLES OF OPERATION

A. Cryogenics Control System

The pump, valve, refrigerator, and heater are connected to a 1K/20W load with a neon indicator across the load.

The "TEMP" control switches either a short or a 100Ω resistor across the sensor lines. The lines are shorted in the "0 DEGREES" position and the temperature indicator can be calibrated. In the "CAL" position a 100Ω resistor is placed across the lines which should result in a full scale reading on the temperature indicator. (300°K or 30°K depending upon which scale is selected.)

A variable current source is provided to check the operation of the vacuum meter. It is a simple variable load on the +15 supply.

B. Pump Regulator

The remote pump shutdown switch requires +5V for the pump voltage to be disabled which is provided by a 1N4734 zener from the +15V supply.

The pump voltage supplied by the regulator is applied to a 6Ω resistor which acts as a pump load. The voltage across the load can be monitored on the test set using the front panel jacks labeled "V MONITOR".

The heater is simulated by a 6Ω load. (Two 12Ω resistors in parallel.) This heater is attached to a mounting block which the LX5600 is clamped to during the testing of a pump regulator.

CRYOGENICS CONTROL SYSTEM TEST PROCEDURE

- 1) Make sure connector ZVP3 is disconnected and apply DC power to the panel.
- 2) With the temperature range switch at 0-30°K, switch "TEMP" switch to "0 DEGREES" and adjust R8 for zero on the temperature meter.
- 3) Switch to the 0-300°K range and put the "TEMP" switch in "CAL". Check for full scale reading.
- 4) Refer to the Temperature vs Output Voltage graph and find the voltage corresponding to the desired pump/valve cutout temperature. Monitor the voltage at Pin 2 of IC₂ and adjust R16 to the voltage found on the graph.
- 5) Turn the test set "VACUUM METER" switch on and adjust the test set front panel pot to see that the vacuum meter will track through its full range.
- 6) Connect AC power plug ZVP3. Apply AC and DC power to the panel.
- 7) Check the following conditions:
 - a) The valve opens in the auto position approximately two minutes after the pump comes on.
 - b) After this time the valve can be opened or closed manually with the valve switch.
 - c) The pump and valve are both shut down in auto when the "TEMP" switch on the test set is switched to "0 DEGREES".
 - d) The valve will open ONLY when the pump is on and the "TEMP" switch is in the "CAL" position.
 - e) The heater is on only when the refrigerator is off and the "TEMP" switch is in the "0 DEGREES" position
 - f) The heater timer functions properly.

TEST SHEET

TEST CONDITIONS: Panel is connected to rack and both AC and DC power are applied. Switches are as follows: Temperature range 0-300, RFF off, pump off, valve closed. Vacuum gauge switch in OPERATE. Measurements taken after calibration. All voltages are with respect to ground.

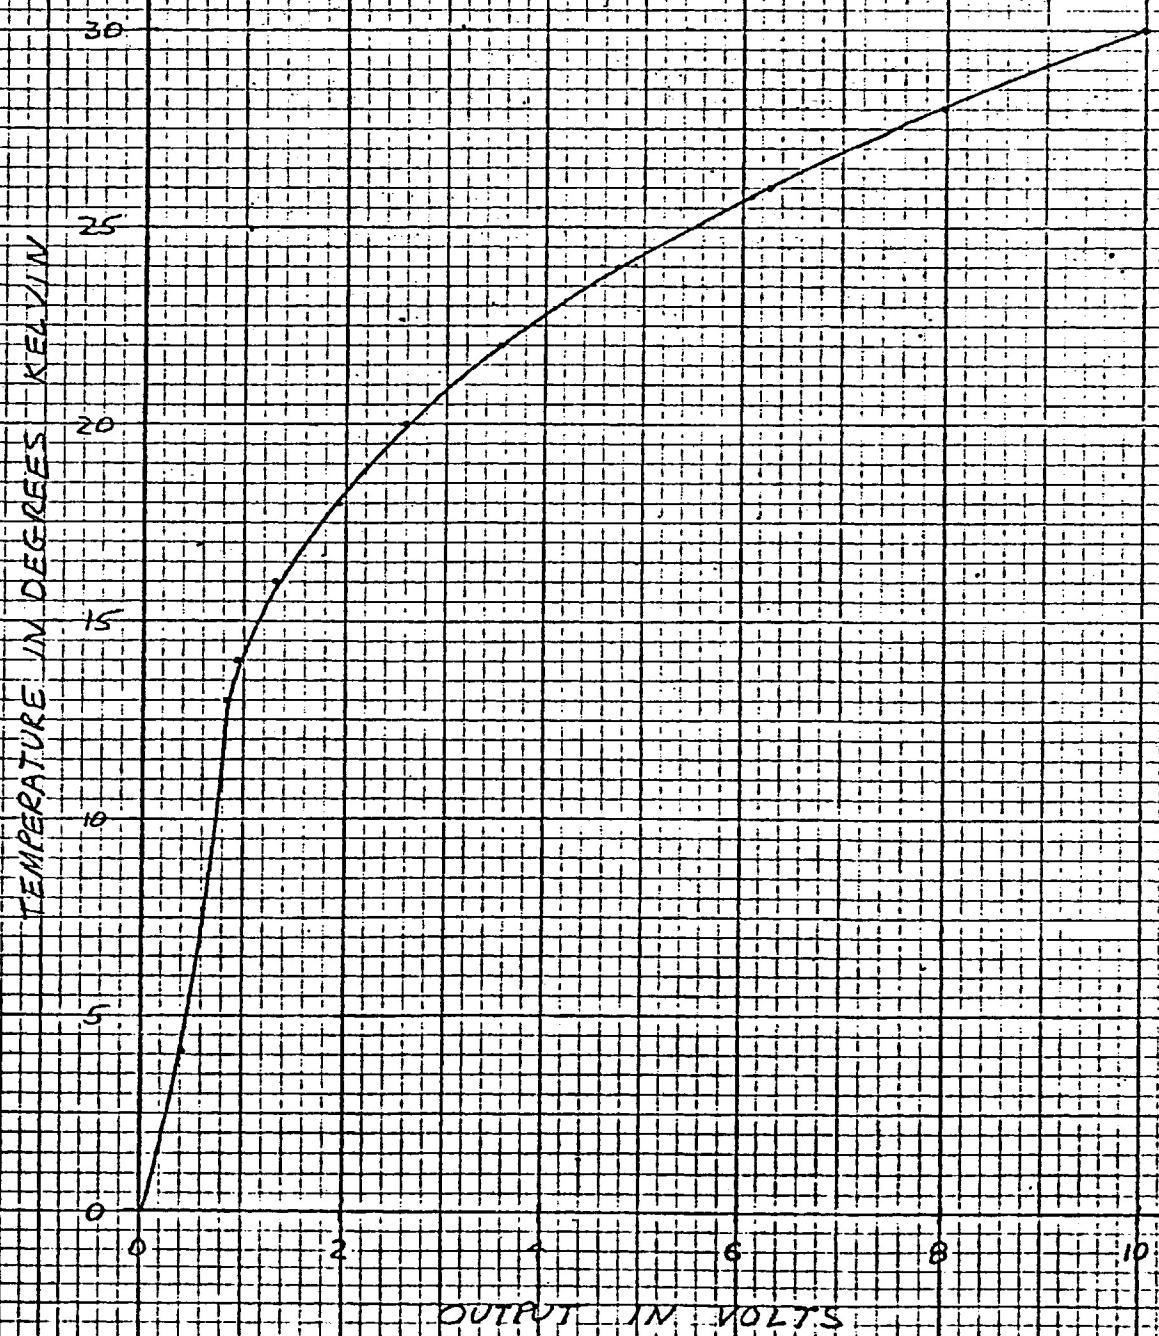

TEST POINT	ALLOWABLE RANGE	MEASURED VALUE	FUNCTION
E25	0-1.11 depending on cold stage temp. (3)		V+ for P+ thermometer
E24	0.00 + .0015		V+ for P+ thermometer
E19	Cold stage temp +5%		0-300°K monitor
E20 E24 & E25 shorted	0.000 + .001		Thermometer Zero
E20 E24 & E25 open	13.5V +1		Thermometer output 0-300°K
IC ₂ -2	Pump/Valve cutout (1)		Pump/Valve cutout set point
E16	-1.5 - -3.5		Helium supply pressure gauge V ⁻
E17	-1.5 - -3.5		Helium return pressure gauge V ⁻
E12	Supply Pressure 30 +5%		Helium supply pressure gauge V _O
E14	Return Pressure 30 +5%		Helium return pressure gauge V _O
E8	Supply Pressure 100 +5%		Helium supply pressure monitor
E10	Return Pressure 100 +5%		Helium return pressure monitor
E9 S5 at Short	0.00 +.01		Vacuum gauge amplifier zero
E9 S5 at Operate	0-10V depending on vacuum (2)		Vacuum gauge amplifier zero
E1	Dewar Pressure +5% (2)		Dewar vacuum monitor

1. Voltage obtained from voltage to temperature chart.
2. Voltage obtained from voltage to vacuum chart.
3. See Rosemount data sheet for value of R_t at a given temperature.

TEMPERATURE VS OUTPUT VOLTAGE
0 - 300°K RANGE

TEMPERATURE VS OUTPUT VOLTAGE
0 - 30 °K RANGE

PUMP REGULATOR TEST PROCEDURES

- 1) Connect the supply connector ONLY. Connect an LX5600 into the socket and clamp it into the mounting block.
- 2) Pump switch in "LOAD".
- 3) Monitor PUMP V and adjust R18 full CCW and full CW. Record the minimum (<5.7V) and maximum (>7.7V) voltages.
- 4) Turn pump switch to "OFF" and attach the pump connector. See that the pump voltage goes to 0.0V. Remove pump connector.
- 5) Monitor I HTR and check that -13V < I HTR < -11V.
- 6) Monitor T MON and check that 13V < T MON < 15V.
- 7) Turn pump switch to "LOAD" and heater "OFF". Plug in the pump connector.
- 8) Attach a thermometer sensor to the heater mounting block close to the LX5600.
- 9) Monitor SUPPLY V. Adjust R18 to read 6.00V.
- 10) Monitor SUPPLY V and put pump switch in the "SHORT" position. Measure voltage as < 1.5V.
- 11) Monitor T MON and set R3 to temperature shown on thermometer, e.g. 2.5V ≡ 25°C.
- 12) Monitor I HTR and turn heater "ON". Within 3 minutes the voltage should drop to approximately 0 volts.
- 13) Monitor T MON. Should be 4.5 - 5.5V.
- 14) Monitor SUPPLY V. Adjust R18 to minimum voltage.

MODEL
HA5-1.2/CVP
HA15-0.5.

SPECIFICATIONS

AC Input: 105-125 VAC, 47-440 Hz (Derate unit 15% at 50 Hz operation)

DC Output:

Model	Voltage	Current (Amps)	OVP
HA5	5	1.2	6.2 ± .4V
HA15	9 to 15	.5	NA

Line Regulation: ±.05% for a 10V input change

Load Regulation: ±.05% for a 50% load change

Output Ripple: 1.5 mV Pk-Pk, 0.4 mV RMS

Transient Response: 30µs set for 50% load change

Overload & Short Circuit Protection: Automatic current limit/feedback

Reverse Voltage Protection: Reverse protection on output

Stability: ±0.05% for 24 hours after warmup

Input Fusing: See Table

Temperature Coefficient: 0.01%/°C maximum, 0.002%/°C typical

Cooling: Units are full rated to 50°C in free air, must be derated or fan cooled when mounted in confined area

Temperature Rating: 0-50°C - 100%
60°C - 60%
71°C - 40%

Efficiency: @ 115 VAC, full load on output
5V & 6V - 40%
12V & 15V - 50%

Note: In systems where the AC voltage is controlled, operate at 103-110 VAC for greatest efficiency

Construction: All aluminum chassis

Weight: 1 lb.

Vibration: Per Mil-Std-810B, Method 514, Procedure I, Curve AB (to 50 Hz)

Shock: Per Mil-Std-810B, Method 516, Procedure V

2 YEAR GUARANTEE

POWER-ONE will repair or replace any power supply of its manufacture that does not perform to published specifications as a result of defective materials or workmanship for a period of 2 years from date of original purchase. No other obligations or liabilities are implied or expressed. Returns must be freight prepaid.

TROUBLESHOOTING GUIDE

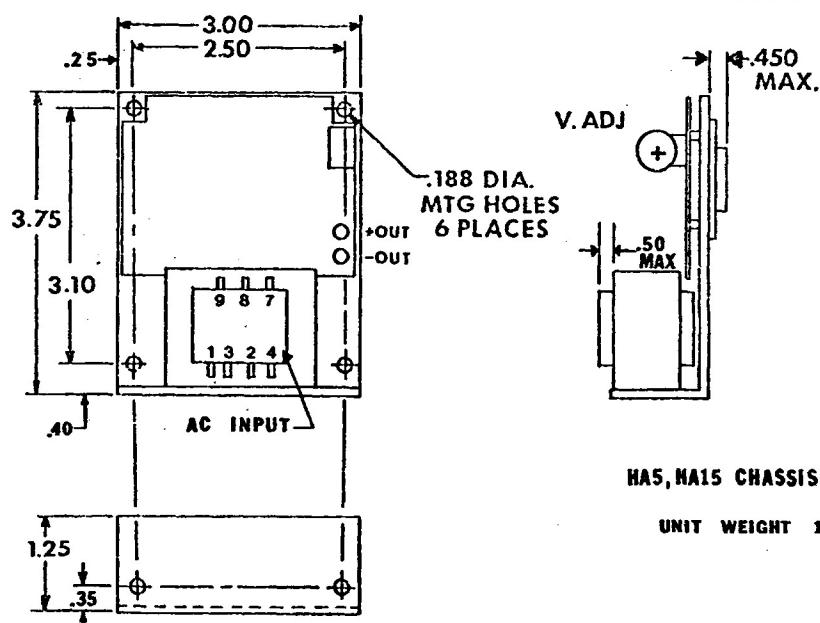

Refer to voltage test points shown on schematic for ease of failure determination
