## Observing Summary 2001

1

- **GBT Maps Venus with Bi-Static Radar.** The Green Bank Telescope's first new scientific results, conducted March 24-26, 2001, were bi-static radar observations of Venus and a close-passing asteroid, in participation with Arecibo. Both GBT and Arecibo received the return echo of S-band delay Doppler radar signals transmitted by Arecibo. The objective was to image high reflectivity areas of Maxwell Montes and Beta Region. The GBT/Arecibo system provides altimetry measurements at a spatial resolution about 5-15 times that of the 1990 Magellan orbiter mission. Imaging information comes from a combination of the delay Doppler echo and interferometric fringes between Arecibo and GBT. Venus was at inferior conjunction, an ideal time. The north-south baseline between Arecibo and GBT aligned with the spin axis of Venus, allowing best interpretation of the radar echos. In addition, radar images of a close-passing asteroid, 1001 EC 16, were obtained only two weeks after its discovery. It was passing by Earth at about 8 times the Earth-Moon distance.
- **Gamma-Ray Burst Host Galaxy Detected.** Observers have made the first detection of radio emission from the host galaxy of a gamma-ray burst (GRB), long after the GRB afterglow has faded away. The detection required more than 70 hours of VLA integration at several frequencies, over a time period between 1-3 years after the burst. The combination of the non-variable radio emission with optical spectroscopy provides evidence that the persistent radio source comes from a starburst galaxies which is forming massive stars at a rate of about 500 solar masses per year, more than 25 times the rate indicated by optical observations. The difference is explained by dust extinction. This result offers the possibility of using GRB-selected galaxies to make an unbiased study of the history of star formation in the universe.
- **VLBA Finds Time-Variable Rotation Measures in Quasar Cores.** Observers have demonstrated for the first time that Faraday Rotation Measures in the nuclei of the quasars 3C273 and 3C279 change significantly on time scales of months. The discovery was made possible by the very high angular resolution, frequency agility, and good polarization characteristics of the VLBA. Previous, lower resolution, observations were dominated by the emission from the less variable jet components far removed from the central engine. The observed variations can tell us about the magnetic fields and density in the immediate environment of the central engine in quasars.
- **The Orion Nebula at 3.6 cm: First Combination of VLA and GBT Data.** This is the first such combination of images and results in a final image that is sensitive to emission on all angular scales down to a resolution of 8.4 arcsec. The GBT image was taken in "on-the-fly" mode on November 1, 2001, and covers a field of about 90 x 90 arcmin. The dynamic range of the image is 11,900:1 and is believed to be the highest dynamic range ever achieved with a single-dish telescope. All flux from the source within the observed bandwidth is retrieved by the GBT, and the image reveals the large scale structure of the nebula. The VLA image is a 3 x 3 mosaic taken in D Array configuration on October 4, 2000. The mosaic covers about 7 x 7 arcmin with a synthesized beam of 8.4 arcsec. The high-resolution VLA image reveals numerous filaments and bright rims of emission. The combination of the two images, performed with AIPS++ software, provides a complete image for full interpretation of both small- and large-scale features. This is a powerful new imaging capability and is expected to be the first of many combinations of GBT and VLA data.

## Observing Summary 2001

2

- **VLA-Pie Town Link Reveals Accretion Disk of Massive Young Star.** The disk is solar-system-sized and circumscribes the young stellar object G192.16-3.82. This object powers one of the largest stellar outflows in the Galaxy. The accretion disk found around this 8-10 solar mass object contains about 20 solar masses. In addition to revealing the inner accretion disk, the VLA showed the inner portion of the outflow and also revealed that the young star has a companion. This is the first time an inner accretion disk has been observed around a massive young star.
- **Six-Image Gravitational Lens System Discovered.** Using the VLBA and Hubble Space Telescope, observers have found the first gravitational lens in which the image of a single background galaxy has been split into six individual images. The lensing is produced by the gravitational field of three intermediate galaxies along the line of sight to Earth. The system is of considerable interest as an intermediate case between lensing produced by single galaxies and that produced by clusters of more numerous galaxies, and thus can be used as a test bed for computational models. VLBA spectral index data on the individual components was critical to confirming the system as a lens.
- **GBT Discovers Three New Binary Millisecond Pulsars in the globular cluster M62.** Discovery observations at 1.4 GHz were made for four hours on August 16, 2001, with the Berkeley-Caltech Pulsar Machine, and confirming results were made in early December. Pulsars were searched at the dispersion measure of the three previously known pulsars in the cluster. PSR J1701-3006D has a spin period of 3.418 ms, an orbital period of 1.118 days, and a minimum companion mass of 0.12 solar masses. PSR J1701-3006E has a 3.234 ms spin period and is orbited by a companion of at least 0.03 solar masses every 0.16 days. PSR J1701-3006F has a 2.295 ms spin period, an orbital period of 0.2 days, and a minimum companion mass of 0.02 solar masses. M62 is the third globular cluster containing six or more known radio pulsars.
- **Black-Hole Microquasar may be Relic of Early Globular-Cluster Star.** An X-ray binary including a 7-solar-mass black hole and an 0.3 solar-mass companion has been shown to have an orbit in the Galaxy's halo, leading researchers to conclude that the black hole is the relic of a very massive star that formed in a globular cluster in the early stages of the Galaxy's history. VLBA observations revealed the object's proper motion, and its proper-motion history later was extended back 43 years by use of digitized Palomar Observatory Sky Survey data produced by Space Telescope Science Institute (STScI). The halo orbit is believed to be the result of the black hole's ejection from the globular cluster through gravitational interaction with other cluster black holes. The companion, now stripped of its outer layers by the black hole, is presumed to have been captured prior to the ejection. This is the first direct evidence of a blackhole remnant of one of the Galaxy's very early supermassive stars.
- **New VLA 74 MHz System Detects Radio Relics.** With the new 74 MHz array, observers have been able to detect steep-spectrum radio emission straddling the center of the merging cluster system Abell 754. Because of the steep spectrum of the radiation it was detected only at 74 MHz and not with the 330 MHz system of the VLA. The location, morphology, and spectrum of the radio emission, as well as the merger shock waves identified at X-ray wavelengths, support the identification of the steep-spectrum radio sources as "radio relics" whose particle acceleration may have resulted from the cluster mergers.

# Observing Hours

## Observing Summary 2001

3

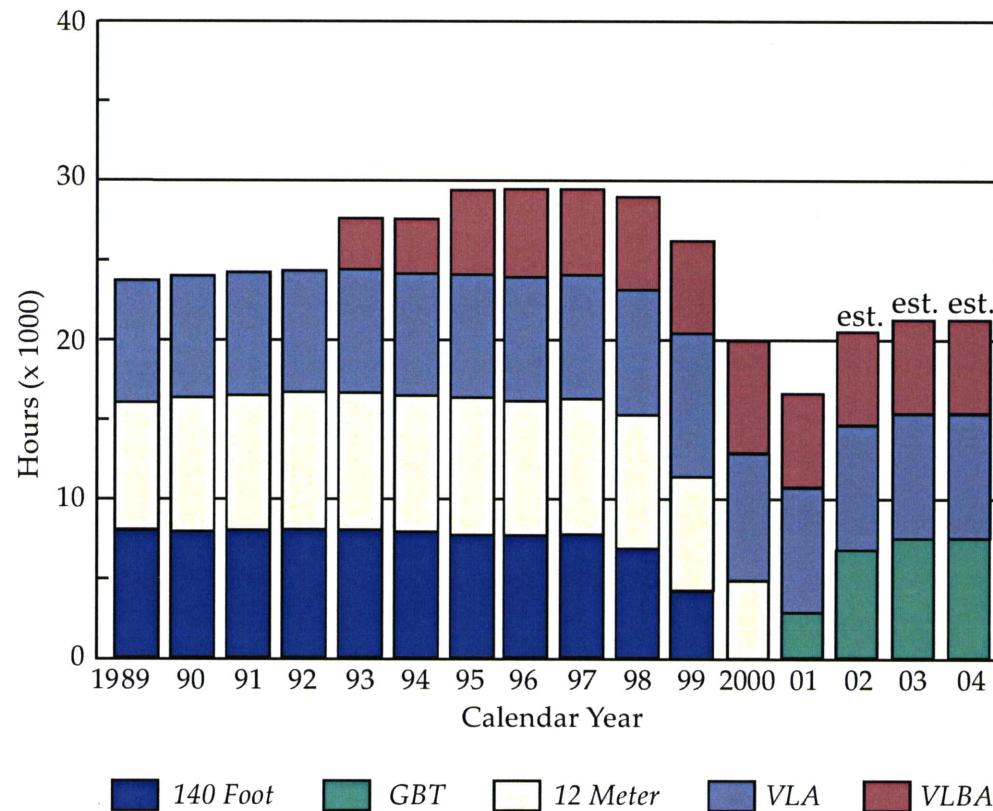

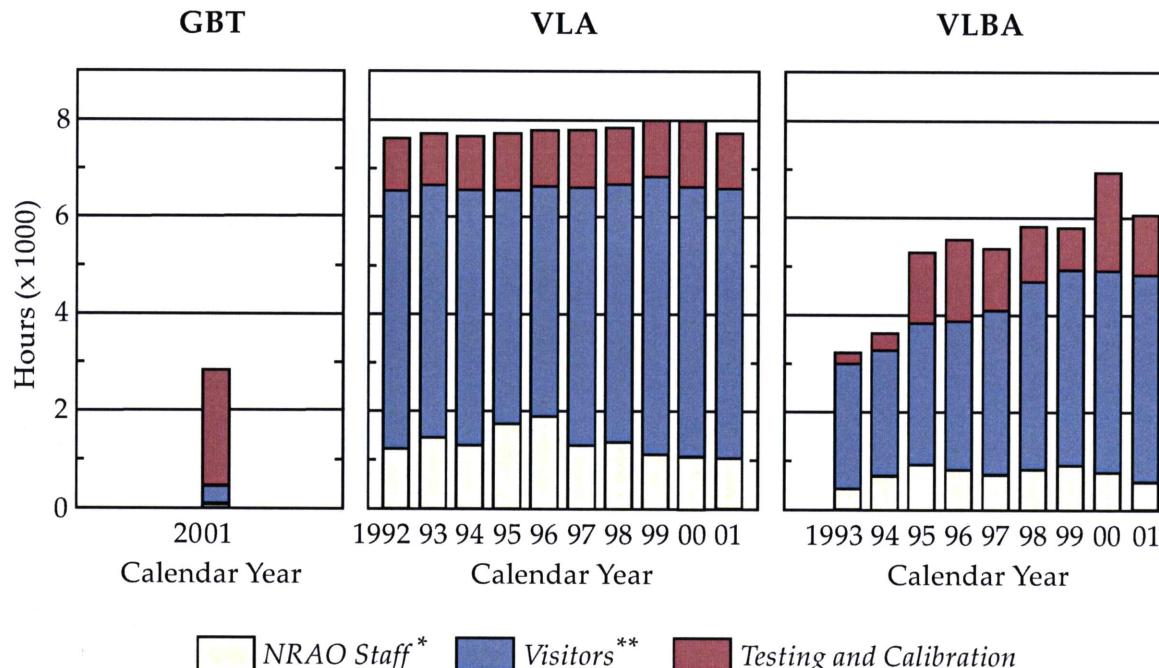

Figure 1. This figure shows the hours for observing on each telescope during the last 16 years. It includes astronomical observing, testing, calibration and commissioning.

# Distribution of Scheduled Observing Time

Observing Summary 2001

4

\* Includes NRAO Research Associates      \*\* Includes Students

Figure 2. These graphs show the number of hours scheduled for testing and calibration, and for observing by the NRAO staff and by visitors on each telescope system.

# Green Bank Telescope Summary

## Observing Summary 2001

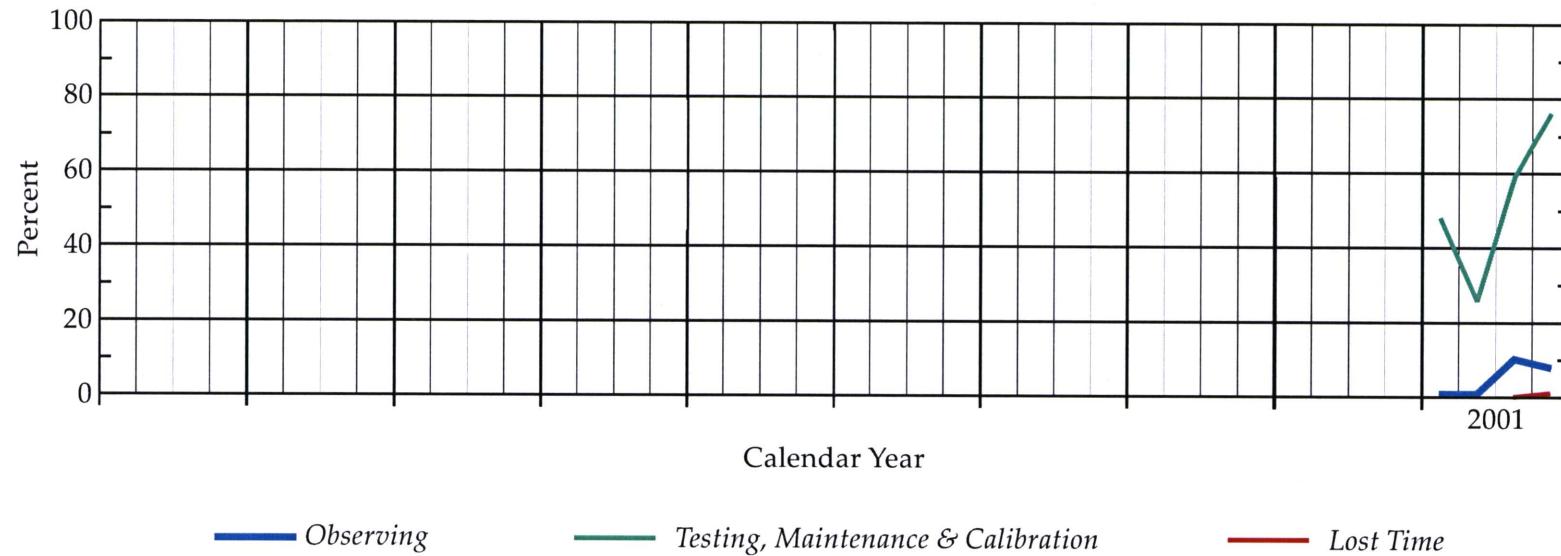

Figure 3. This summary for each quarter of the calendar year shows the percentage of the total time in the year (8760 hours) that the telescope was scheduled for observing; for commissioning, maintenance, and calibration; and the percentage of time lost due to equipment failure, bad weather, and radio interference.

# Very Large Array Telescope Summary

## Observing Summary 2001

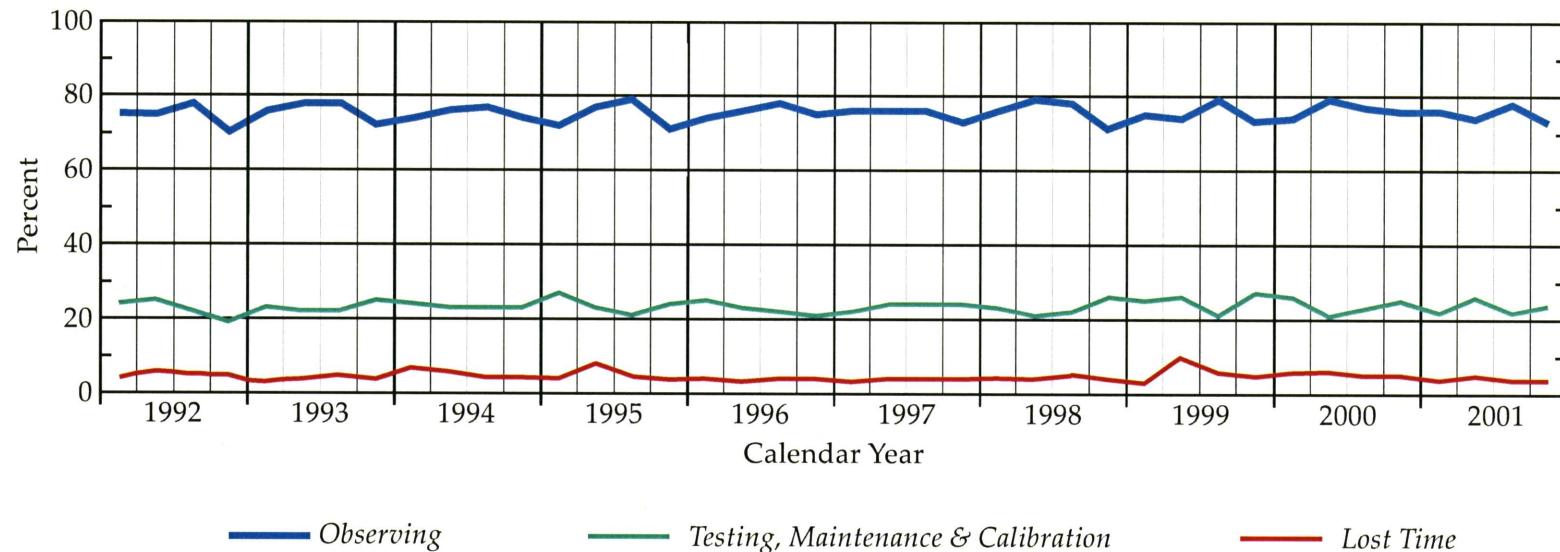

Figure 4. This summary for each quarter of the calendar year shows the percentage of the total time in the year (8760 hours) that the telescope was scheduled for observing; for routine system testing, maintenance, and calibration; and the percentage of time lost due to equipment failure, bad weather, and radio interference.

# Very Long Baseline Array Telescope Summary

## Observing Summary 2001

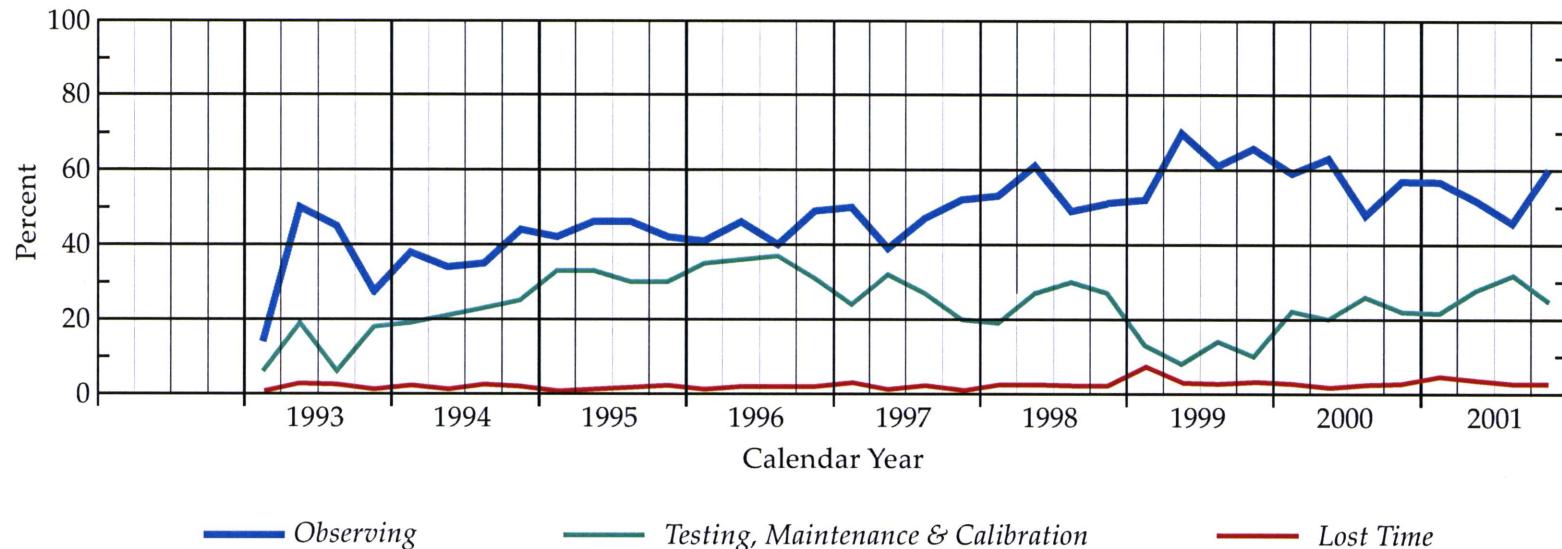

Figure 5. This summary for each quarter of the calendar year shows the percentage of the total time in the year (8760 hours) that the telescope was scheduled for observing; for routine calibration, maintenance, and installation of new experiments; and the percentage of time lost due to equipment failure, bad weather, and radio interference. It should be noted that about 15 percent of the time cannot be scheduled as it results from the time difference across the array; this is reflected as a difference in the time between the end of one program and the start of the next.

# Full-Time Employees

Observing Summary 2001

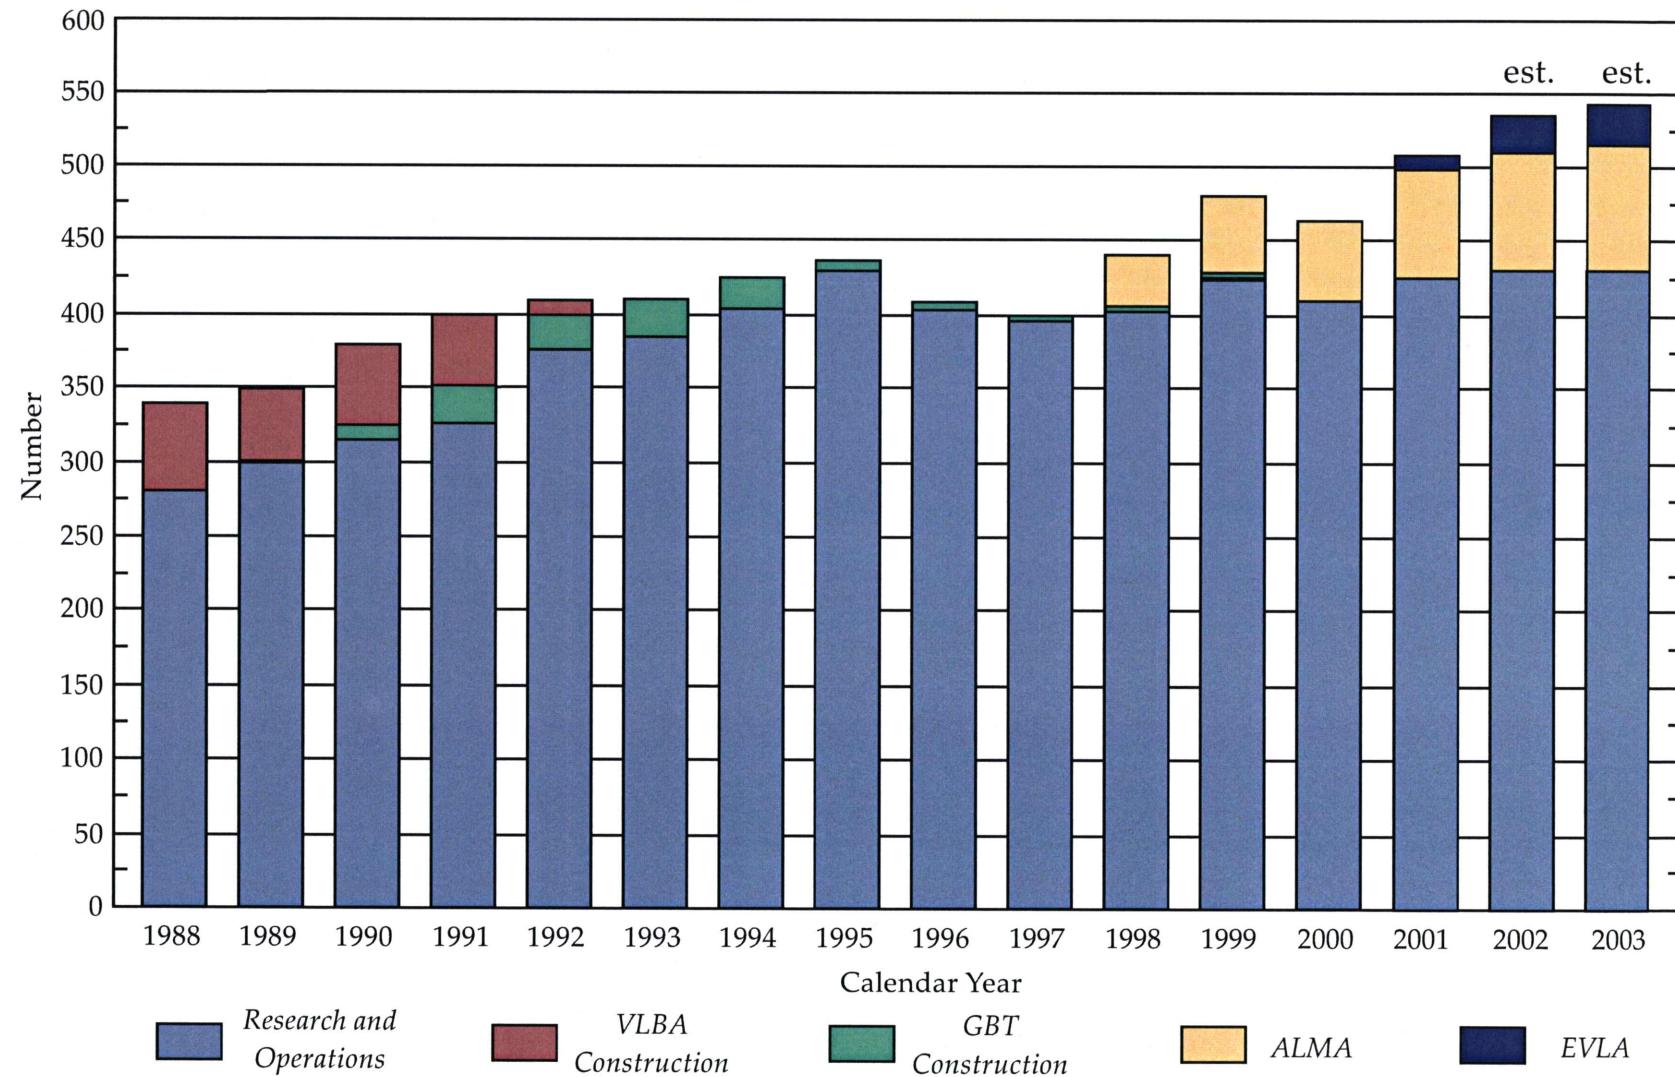

Figure 6. This figure shows the total number of NRAO full-time employees at the end of each year, projected into the future.

# Number of People Observing with NRAO Telescopes

## Observing Summary 2001

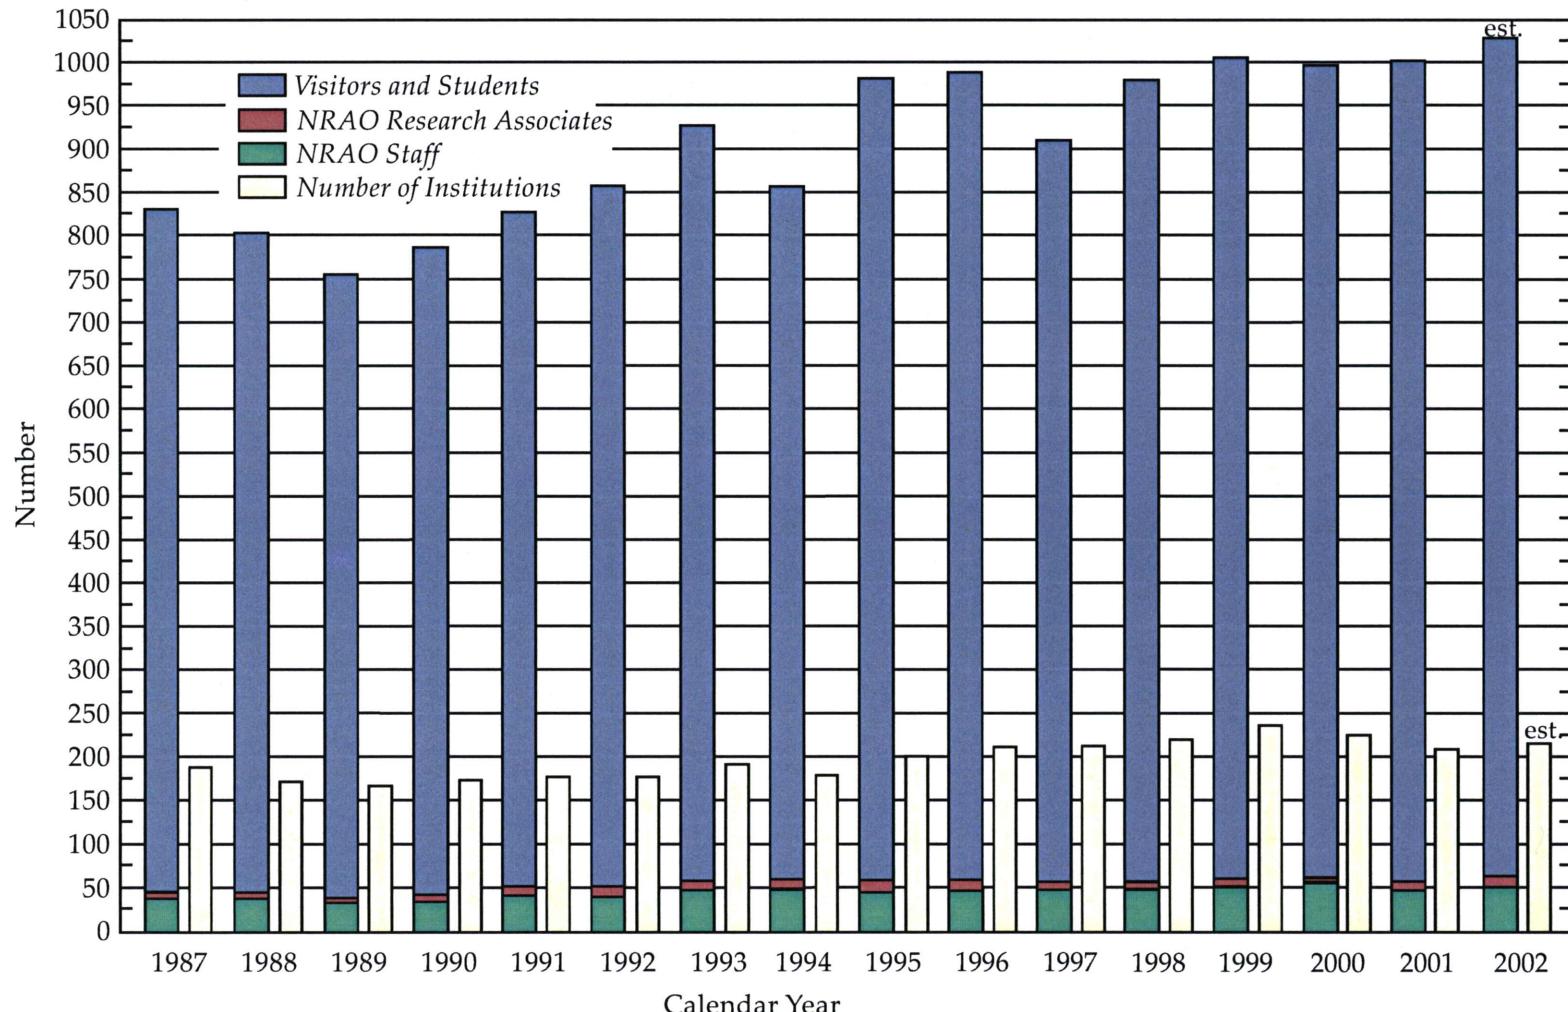

Figure 7. The bar chart shows for each calendar year the number of NRAO research staff and the number of NRAO research associates who used the telescopes. In addition, it shows the total number of visitor-users of NRAO telescopes and the number of institutions from which the NRAO visitors came.

## Observing Summary 2001

23

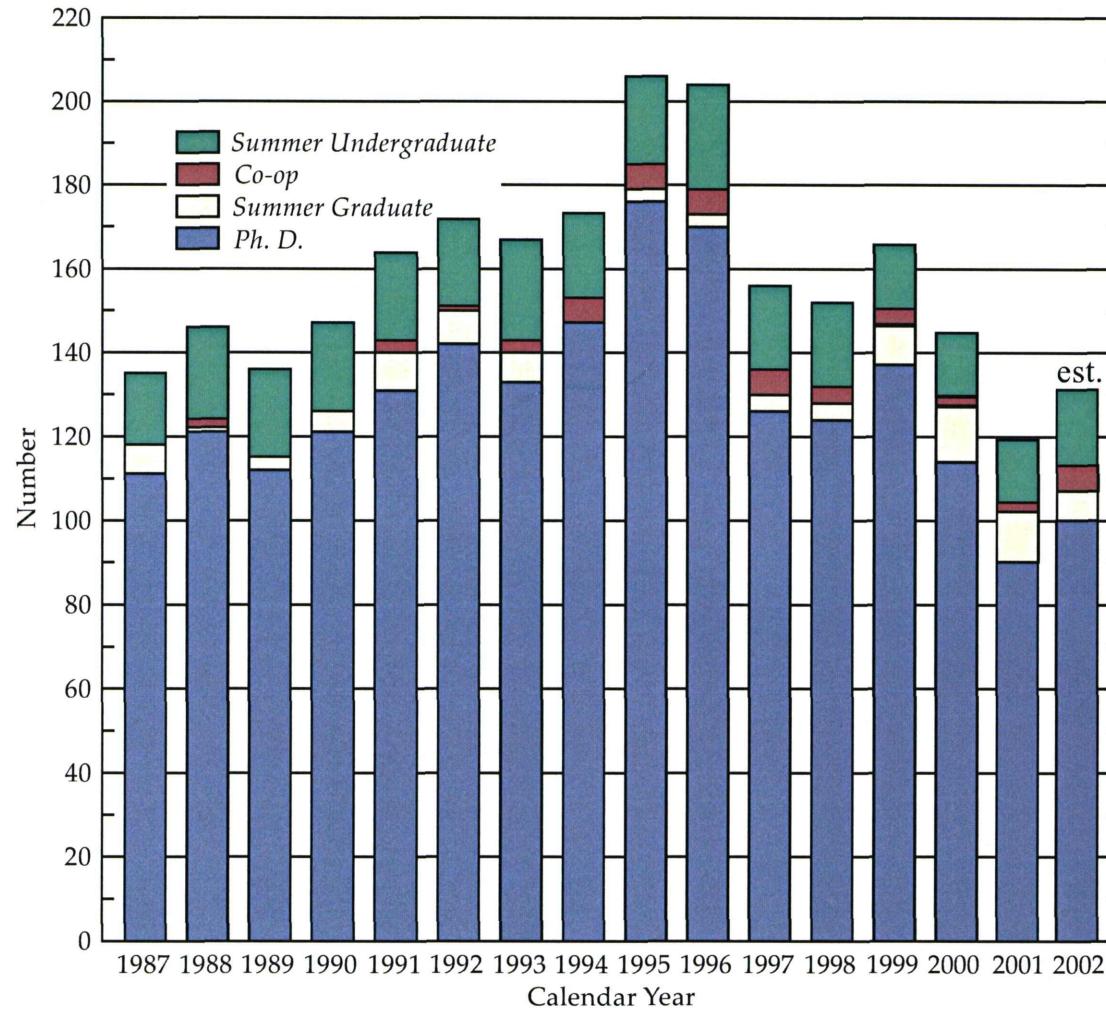

Figure 8. This figure shows for each calendar year the number of PhD students (salaried at NRAO and non-salaried), co-op students, and summer undergraduate and graduate students who observed or worked at the NRAO during that year. Beginning in 1987 the majority of the undergraduate summer students were funded by a separate NSF Grant for Research Experience for Undergraduates.
